METHOD AND MECHANISM FOR SUPERPOSITIONING STATE VECTORS IN A SEMANTIC ABSTRACT

ABSTRACT

5   State vectors representing the semantic content of a document are created. The state vectors are superpositioned to construct a single vector representing a semantic abstract for the document. The single vector can be normalized. Once constructed, the single vector semantic abstract can be compared with semantic abstracts for other documents to measure a semantic distance between the documents, and can be used to locate documents with similar

10   semantic content.
